

A COLLABORATIVE ONLINE EVENT

# PUSHING THE BOUNDARIES OF ACHIEVEMENT

A SERIES ON THE LATEST EVOLUTION OF APPLIED NEUROSCIENCE

Thank you for joining us today, along  
with our international partners

# Your Panelists

Alex Kitzes Ph.D.

Clinical Psychologist & Co-Founder of Stronger Brains Inc, USA

Cheryl Chia

Physiotherapist & Founder of Singapore-based BrainFit

Dave Stanley

Director of Learning Ecosystems at LearnFast Australia

# Your Presenter | Steve Miller, PhD

Steve works as an applied neuroscientist and technology executive with more than 25 years of industry experience.

Dr. Miller authored or co-authored more than 100 publications including numerous multi-site research studies, commercial software programs and U.S. Patents. A majority of his patents have been licensed, brought to commercial practice, and in 2000 he was a co-recipient of the Thomas Alva Edison Patent Award in Medicine for this work.

As a business executive, he is a passionate collaborator with broad business experience in technology transfer and translational research.

# Elite Learning: Some Best Practices in Attention & Memory

# Brain Plasticity is Lifelong

Plasticity refers to the ability of the brain to change through experience and learning.

Behavioral  
Training

- Synchronous Neural Activity (Frequency)
- Competition for Neural Space (Adaptive)
- Discriminating Neural Activity (Simultaneous Development)
- Rewarded Neural Activity (Timely Motivation)

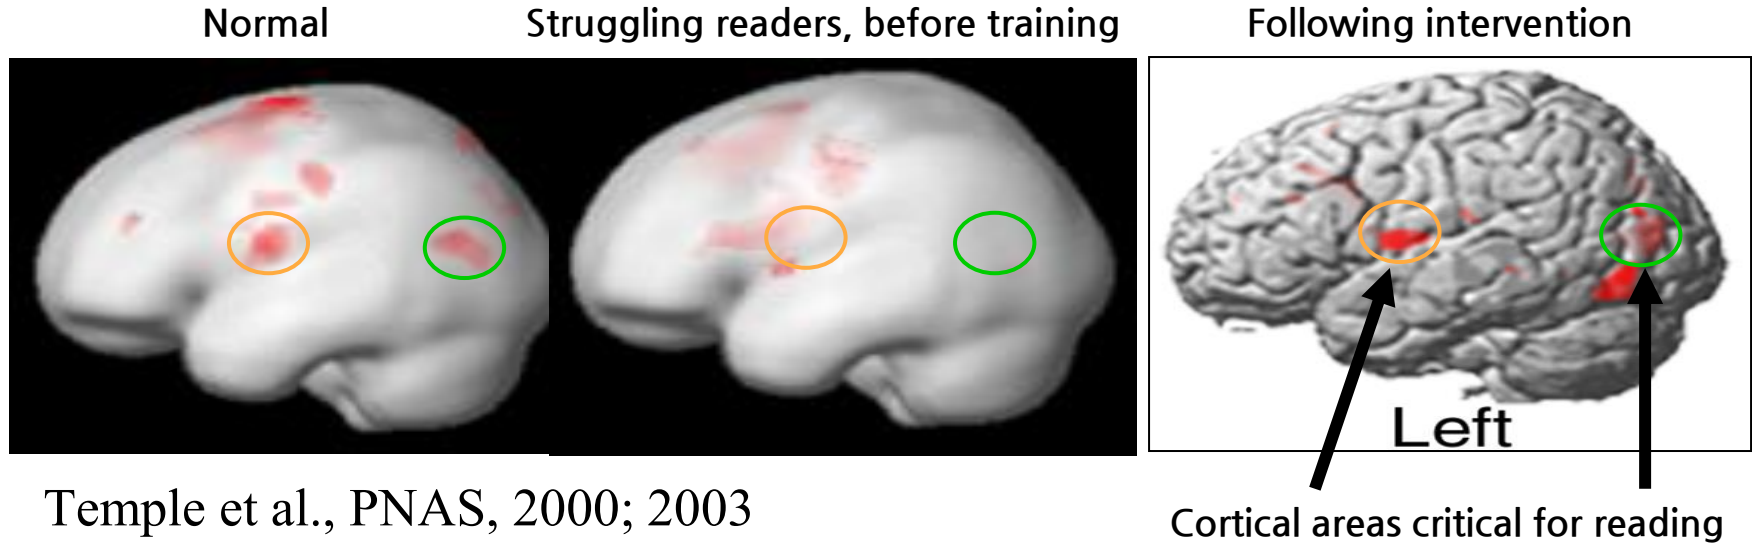

Jenkins et al (1990).

### ACTIVE study: Well-targeted brain training might significantly reduce dementia risk

By: SharpBrains

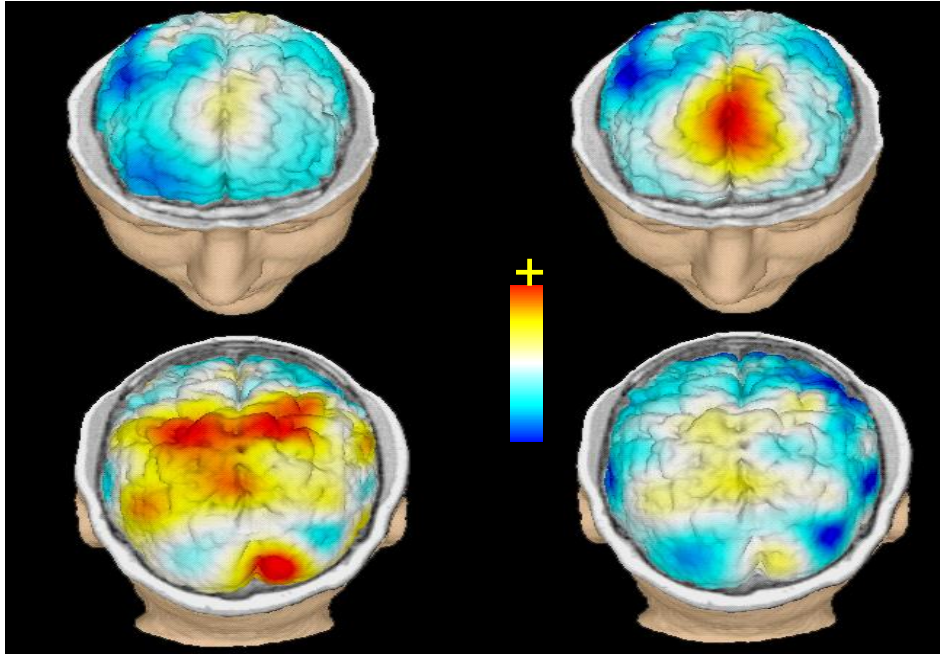

—An example of a speed-of-processing task. Courtesy of Posit Science

After 10 years, only the speed-of-processing training group showed a statistically significant impact on cognition. The researchers detected a 33 percent reduction ( $p=0.012$ ) in risk of developing cognitive decline or dementia over those 10 years in those assigned to the speed training group. Participants who did the booster sessions – those who participated in 11 or more sessions of the computerized training – showed a 48 percent reduction in risk of developing cognitive decline or dementia over time. There was no significant difference in the other two training groups.

# Brainwave Analysis

## Relating EEG Parameters to Cognition

Thousands of controlled laboratory experiments have shown that EEG rhythms systematically vary as a function of test condition.

Spatial maps of EEG spectral power shown here reveal different levels of mental engagement when performing an easy laboratory test versus a difficult test.

“Disengaged”

“Engaged”

From a young age the ability to evaluate risk and reward as well as delay gratification are correlated with higher academic performance later in life.

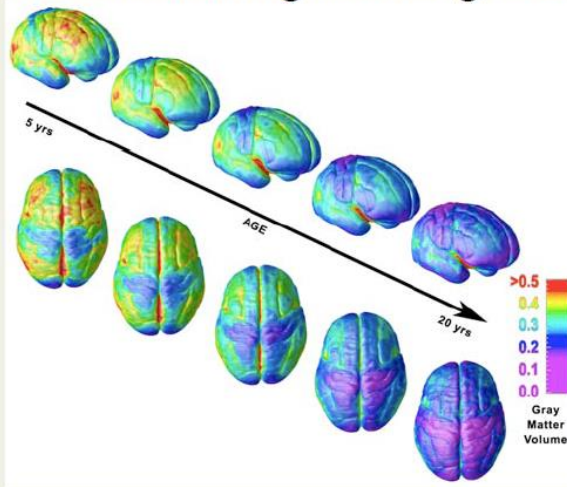

Note: this is what we observe, not limiting what can be...

# Attention-Deficit/Hyperactivity Disorder

Attention-deficit/hyperactivity disorder (ADHD) is a disorder marked by an ongoing pattern of inattention and/or hyperactivity-impulsivity that interferes with functioning or development.

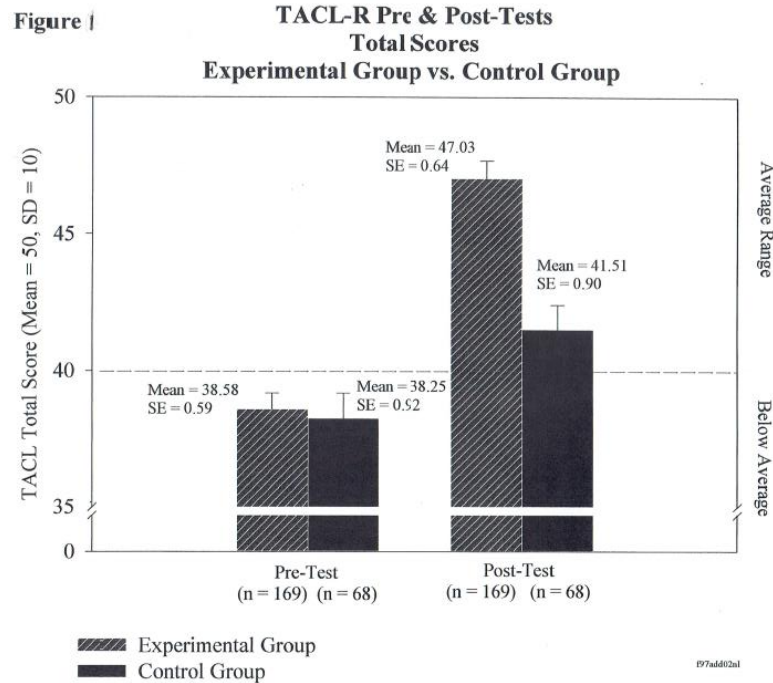

**Inattention** a person wanders off task, lacks persistence, has difficulty sustaining focus, and is disorganized; and these problems are not due to defiance or lack of comprehension.

**Hyperactivity** a person seems to move about constantly, including in situations in which it is not appropriate; or excessively fidgets, taps, or talks. In adults, it may be extreme restlessness or wearing others out with constant activity.

**Impulsivity** a person makes hasty actions that occur in the moment without first thinking about them and that may have a high potential for harm, or a desire for immediate rewards or inability to delay gratification. An impulsive person may be socially intrusive and excessively interrupt others or make important decisions without considering the long-term consequences.

Feedback

# Summary

- New opportunities exist for inducing, maintaining or reversing learning to achieve the desired outcomes.
- Neuroscience tools can facilitate learning in real-time in the classroom using learning content.
- Closed-Loop Learning: The neural circuits for memory, attention, processing and sequencing are continuously refined through learning and we can track and train them in real-time.
